NBR	-40 + 120 olio (90 acqua)	Buona resistenza a olii, grassi minerali, acqua, fluidi per radiatori, buona resisten-	Scarsa resistenza all'ozono, chetoni, estere, esteri, idrocarburi clorurati, solventi aromatici.	Standard Acciaio
		za all'usura	non resiste al fluido per freni (base glicol)	A richiesta AISI 316
FPM	-30 + 200	Buona resistenza a oli, acidi, idrocarburi aromatici, clorurati, ozono, ottima resi- stenza alla temparatura	Scarsa flessibilità alle basse temperature, ai fluidi polari (chetoni, etere, esteri)	AISI 316
SIL	-60 + 200	Buona resistenza a oli, grassi minerali, ozono, alcali, ottima flessibilità a tempe- rature molto basse, scarso indurimento alle alte temperature in conitnuo	Sconsigliato per l'uso a contatto con idrocarburi come benzene, parafina. Non resiste all'acqua bollente, agli acidi e fluidi freni. Scarsa resisten- za all'usura.	AISI 316

Finiture e tolleranze delle parti metalliche

ALBERO

La finitura superficiale dell'albero è di primaria importanza sia per la tenuta che per la durata del labbro di tenuta. La norma DIN 3760 prevede che la durezza minima richiesta è di 45 HRC. A velocità lineari di 4 m/sec la durezza dovrebbe essere di 55 HRC e a 10 m/sec 60 HRC.

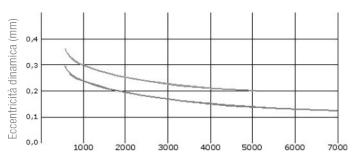

La finitura superficiale, come specificato dalla DIN 3760, deve essere tra R=1 e 4 $\mu m.$ Si ricorda che la superficie deve essere esente da imperfezioni di lavorazione o graffiature che , possono causare l'aumento dello spessore del film tra albero e spigolo di tenuta, provocando delle perdite. Il materiale più comunemente usato è acciaio temperato. La tolleranza h11, secondo lo standard ISO UNI 6388-68 prevede i seguenti valori riportati nella tabella a seguire.

Ø ALI	BER0	TOLLE	RANZA
da	fino a	h ⁻	11
6	10	0	-0,090
10	18	0	-0,110
18	30	0	-0,130

50	80	0	-0,190
80	120	0	-0,220
120	180	0	-0,250
180	250	0	-0,290
250	315	0	-0,320
315	400	0	-0,360

ECCENTRICITÀ DELL'ALBERO

La condizione ottimale per consentire all'anello di tenuta la migliore prestazione è di avere un albero in rotazione perfettamente centrato e concentrico rispetto alla sede dell'anello di tenuta. In molte applicazioni una certa eccentricità è inevitabile, pertanto il labbro di tenuta deve compensare il più possibile questi spostamenti. Il disassamento tra albero e sede in situazione statica va ridotto il più possibile, per evitare di caricare il labbro in modo continuativo nello stesso punto. Segue curva eccentricità/velocità albero.

Velocità albero RPM

SEDE

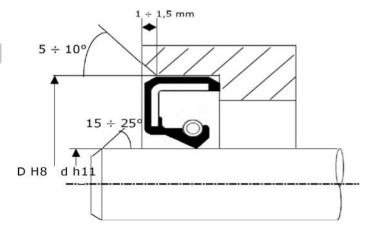

Per la sede non è richiesta una particolare finitura, deve comunque essere superiore a 3,2 μ m Ra. Il diametro esterno dell'anello di tenuta ha una tolleranza che assicura un accoppiamento stabile tra anello e sede. E'importante che l'anello non risulti posizionato obliquamente nella sua sede. Realizzare sempre uno smusso sull'imbocco della sede, da 5 a 10°, con una profondità di 1 mm per anelli con altezza (spessore) fino a 10 mm e di 1,2 - 1,5 mm per anelli con altezza superiore.

Le tolleranze di lavorazione H8 del diametro delle sedi, secondo lo standard ISO UNI 6388-68, sono riportate nella tabella che segue.

Ø ALI	BER0	TOLLE	RANZA
da	fino a	h	8
10	18	+0,027	0

315	400	+0,089	0
400	500	+0,097	0

TOLLERANZE DI MONTAGGIO

Tolleranze di montaggio ed eccentricità ammesse in accordo alle norme DIN 3760. Il diametro deve essere misurato in due punti, sfasati di 90°, come prevede la DIN 3761 parte 6. Il valore da utilizzare è la media fra le due misure. L'eccentricità permessa non deve essere superata da ogni misura singola.

Ø ALBERO			TOLLERANZA DI MONTAGGIO			ECCENTRICITÀ PERMESSA

LUBRIFICAZIONE E TEMPERATURA

La lubrificazione è molto importante per il buon funzionamento dell'anello. Il labbro di tenuta non deve strisciare a contatto diretto dell'albero ma su un film di lubrificante . Lo spessore del film è normalmente fra $1\,$ – $3\,\mu m$, tale spessore è determinato da tanti fattori vari, la viscosità dell'olio, la finitura superficiale, il carico radiale dell'anello , la temperatura , e non da ultima l'eccentricità.

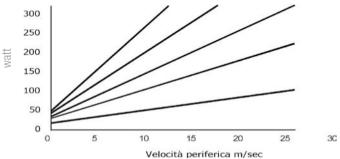

Le prime ore di funzionamento servevono da assestamento del labbro e del filo di tenuta. Durante questo periodo è possibile una piccola perdita.

TEMPERATURA PER ATTRITO DEL LABBRO DI TENUTA

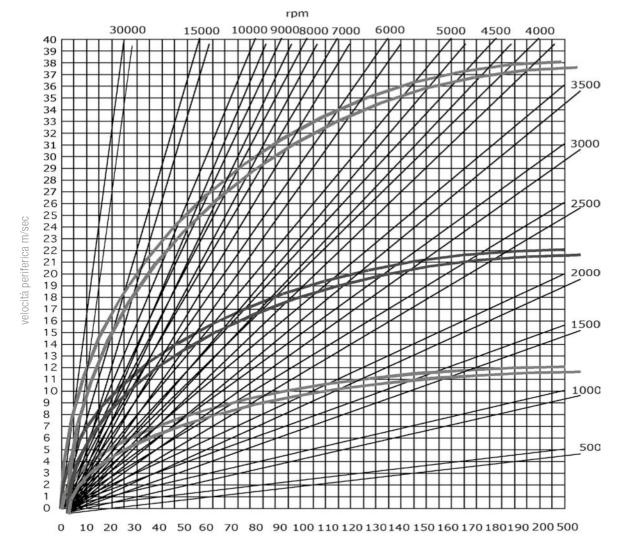

La temperatura sul labbro di tenuta è pari a quella del lubrificante aumentata del valore dovuto al riscaldamento per attrito. Più alta sarà la temperatura Una adeguata lubrificazione riduce molto l'attrito tra il labbro e l'albero ed agisce inoltre come refrigerante per il calore generato. Per una vita più lunga dell'anello mantenere bassa la temperatura è un requisito fondamentale. In presenza di fluidi con scarsa capacità lubrificante si consiglia di usare gli anelli tipo AS, B1SL o B2SL. In questo caso lo spazio tra il labbro di tenuta e il parapolvere deve essere riempito con del grasso. L'attrito non è solo causa di usura dell'anello di tenuta ma è anche causa di perdita di potenza che potrebbe essere importante se le potenze in gioco sono limitate. Seguono le curve relative al riscaldamento e alla perdita di potenza in funzione della velocità di rotazione.

PERDITA POTENZA PER ATTRITO

di lavoro più rapido sarà l'invecchiamento dell'elastomero, con conseguente diminuzione della tenuta.

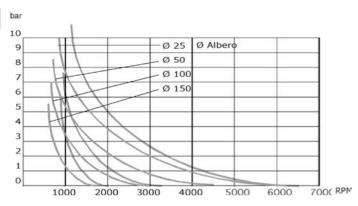

PRESSIONE

Quasi tutte le applicazioni in cui sono utilizzati gli anelli di tenuta presentano pressioni di lavoro piccole o inesistenti. In alcuni casi l'anello di tenuta può essere sottoposto a pressione, con conseguenti problemi sulla tenuta stessa, esempio il ribaltamento del labbro di tenuta. Sopra gli 0,2 bar e con alte velocità periferica o sopra gli 0,5 bar e velocità più moderate, si devono utilizzare anelli di sostegno o anelli di tenuta in esecuzione speciale con labbro di tenuta e inserto metallico più resistenti. Nel secondo caso parliamo degli anelli di tenuta tipo AS-P. Il diagramma seguente stima la pressione in funzione dei giri.

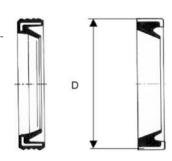

Se si utilizzano anelli di sostegno è possibili impiegare anelli di tenuta standard. E'comunque più vantaggioso sia per i costi che per l'intercambiabilità optare in caso di pressione per gli anelli di tenuta tipo AS-P.

ANELLI DI TENUTA TIPO VCW - VB

Descrizione

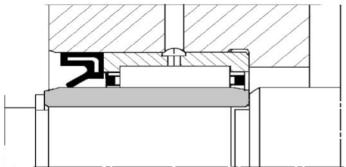

Anelli senza molla per l'utilizzo su alberi rotanti e con movimento alternativo. Nel secondo caso vengono usati come raschiatori. Sono rinforzati con un inserto metallico, hanno un singolo labbro sottile in elastomero, sono senza molla ed una minima interferenza al montaggio. Tutto questo fa si che l'attrito tra il labbro e l'albero sia minimo. Per un fissaggio migliore in cava, l'esterno dell'anello ha delle ondulazioni in elastomero, ad eccezione delle misure per alberi fino a Ø 7 mm che sono con esterno metallico.

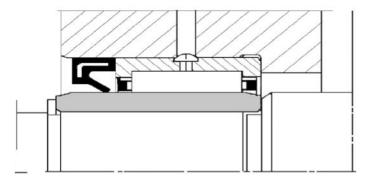

Gli anelli tipo VCW standard hanno l'elastomero in nitrilico NBR con inserto in acciaio al carbonio. Su richiesta sono fornibili con l'elastomero in FPM e l'inserto in acciaio Inox.

Utilizzo tipico come tenuta

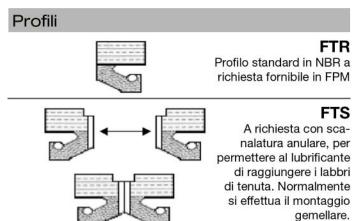

ANELLI TIPO FTR FTS

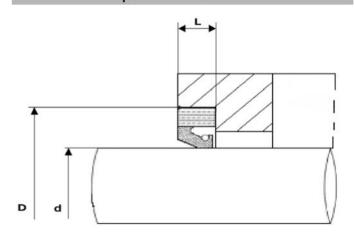

Descrizione

Gli anelli di tenuta tipo FTR e FTS hanno diametro esterno rinforzato in gomma tela, labbro di tenuta in gomma e molla in acciaio AISI 302. Gli anelli serie FT sono progettati come anelli di tenuta per cuscinetti nei laminatoi, industria cartaria e applicazioni marine. Offrono parecchi vantaggi:

- 1. non è essenziale un'accurata finitura della sede
- 2. estrema facilità di montaggio
- 3. nessun problema di corrosione
- 4. facilità nella sostituzione

ANELLI TIPO FTR SPLIT

Descrizione

L'anello FTR Split è un anello di tenuta senza inserto metallico, tagliato (split), per favorire il montaggio dell'anello in posizioni ove non sia possibile lo smontaggio delle parti meccaniche, oppure lo smontaggio e il rimontaggio delle stesse sia molto costoso. Sono prodotti standard in elastomero NBR a richiesta possono essere forniti in FPM. La figura 1 mostra l'accoppiamento delle parti tagliate dopo il montaggio in sede. FTR Split deve essere installato con l'apertura in corrispondenza al punto più alto dell'albero (H vedi figura 2) e non va usato dove il livello del fluido (in posizione statica), è più alto del punto più basso dell'anello. La sede dell'anello deve essere provvista di flangia per dare compressione assiale all'anello stesso.

ANELLI DI TENUTA VLIP

Descrizione

V lip tipo: PA

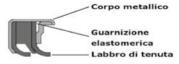

Profili a standard

Guarnizione
elastomerica
Labbro di tenuta

Il tipo PA è una tenuta a un labbro adatta per le aplicazioni industriali con pressione $\max=5$ bar, laddove una guarnizione radiale non sarebbe in grado di resistere a temperatura, attrito, scarsa lubrificazione. Questo profilo consente velocità periferiche fino a 40 m/sec.

V lip tipo: PB

Profili a richiesta

Il tipo PB è la scelta migliore per applicazioni che richiedono una elevata tenuta o sia necessario effettuare una tenuta contro fluidi contaminati.

V lip tipo: PC

Profili a richiesta

Guarnizione
elastomerica
Labbro di tenuta

Il tipo PC viene impiegato per quelle applicazioni con pressioni più elevate per le quali non è più sufficiente una semplice tenuta radiale elastomerica. Grazie al labbro di tenuta rinforzato, sono ammissibili pressioni fino a 20 bar.

V lip tipo: PD

Il tipo PD a differenza dei profili PA-PB-PC che possono essere impiegati per una tenuta esposta alla pressione solo da un lato, può essere impiegato con pressione da entrambi i lati. Sono ammesse pressioni fino a 1 bar. Un pratico utilizzo può essere per separare due fluidi diversi. Si consiglia di mettere grasso fra i labbri di tenuta

Criteri di scelta

	PD	40	> 30 HRC				
		78	>170 HB				

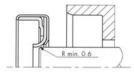

Descrizione

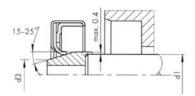

Le guarnizioni per albero V-lip si adattano nella maggior parte dei casi alle cave conformi alla DIN 3760.

Smussi d'imbocco

Per evitare danni al labbro di tenuta, è necessario porre molta attenzione durante il montaggio del V-lip. Se la guarnizione viene montata posteriormente rispetto all'albero, le estremità dell'albero devono essere arrotondate o provviste di smussi di imbocco. Quando la guarnizione viene montata su un albero con il labbro di tenuta contro l'estremità dello stesso, è necessario prevedere uno smusso d'imbocco il cui diametro più piccolo sia inferiore al diametro del labbro di tenuta non sollecitato. La tabella I che segue contiene i valori guida per tale eventualità.

Montaggio posteriormente rispetto all'albero.

Montaggio mediante attrezzo di montaggio.

INDELLINI			
diamentro albero d	6-60	65-135	140-170
Diametro	d-3	d-4	d-5,5

Rugosità superficiale dell'albero

Per un buon funzionamento in tenuta e durata, sono molto importanti la qualità della finitura della superficie di contatto. Non sono ammessi graffi, scanalature, porosità, segni di lavorazione concentrici o a spirale. E'molto più importante la finitura della superficie dinamica rispetto a qualla statica (fondo cava). Nella tabella II i parametri standard di lavorazione.
